Dear Parents,

BridgePrep Academy Schools are monitoring the Centers for Disease Control and Prevention (CDC) warnings regarding the Coronavirus and will be in contact with parents in the unlikely event that the school community is affected. Attached you will find a Fact Sheet from the CDC regarding the Coronavirus. This sheet contains information on how to protect yourself and your children, and how to treat them in the event of contracting it.

As always, to prevent widespread communicable illnesses in the school, we recommend that your child stay home from school if he or she is experiencing flu or cold symptoms. Colds and most viral illnesses are the most contagious during the first 48 hours. A student who has a fever should remain at home until "fever free" for a minimum of 24 hours without the need for over the counter medicines, as this only masks symptoms. A student who has started antibiotics needs to be on the medication for 48 hours before considered non-contagious and able to return to school. Remember that keeping a sick child at home will help minimize the spread of infections and viruses in the classroom.

For more information on the Coronavirus, visit CDC.gov.

Best Regards,

Yvette Rodriguez
Principal

Novel Coronavirus (2019-nCoV) and You

What is 2019 novel coronavirus?

The 2019 novel coronavirus (2019-nCoV) is a new virus that causes respiratory illness in people and can spread from person-to-person. This virus was first identified during an investigation into an outbreak in Wuhan, China.

Can people in the U.S. get 2019-nCoV?

This 2019-nCoV virus does seem to be able to spread from person-to-person although it's not clear how easily this happens. Person-to-person spread in the United States has not yet been detected, but it's likely to occur to some extent. At this time this virus is not spreading in the United States so the likelihood of someone in the U.S. getting sick with this virus is very low. Right now, the greatest risk of infection is for people in Wuhan or people who have traveled to Wuhan and less so, other parts of China. CDC continues to closely monitor the situation.

Have there been cases of 2019-nCoV in the U.S.?

Yes. The first infection with 2019-nCoV in the United States was reported on January 21, 2020. The current count of cases of infection with 2019-nCoV in the United States is available on CDC's webpage: www.cdc.gov/coronavirus/2019-ncov/cases-in-us.html

How does 2019-nCoV spread?

The exact way the virus is spread is not fully known. With similar coronaviruses (MERS and SARS) person-to-person spread is thought to have happened mainly via respiratory droplets produced when an infected person coughs or sneezes, similar to how influenza and other viruses that cause respiratory illness spread. There also may be some spread when a person touches a surface or object that has virus on it and then touches his or her own mouth, nose, or possibly their eyes. Spread of SARS and MERS between people has generally occurred between close contacts. There is much more to learn about 2019-nCoV and investigations are ongoing.

What are the symptoms of 2019-nCoV?

Patients with 2019-nCoV have reportedly had mild to severe respiratory illness with symptoms of:

- fever
- cough
- shortness of breath

What are severe complications from this virus?

Many patients have pneumonia in both lungs.

How can I help protect myself?

- This virus is not spreading in the United States right now, but the best way to prevent infection is to avoid being exposed to this virus. There are simple everyday preventive actions to help prevent the spread of respiratory viruses. These include:
 - Avoid close contact with people who are sick.
 - Avoid touching your eyes, nose, and mouth with unwashed hands.
 - Wash your hands often with soap and water for at least 20 seconds. If soap and water are not available, use an alcohol-based hand sanitizer.

If you are sick, to keep from spreading respiratory illness to others, you should:

- Stay home when you are sick.
- Cover your cough or sneeze with a tissue, then throw the tissue in the trash.
- Clean and disinfect frequently touched objects and surfaces.

What should I do if I recently traveled to China and got sick?

If you were in China within the past 14 days and feel sick with fever, cough, or difficulty breathing, you should get medical care. Call the office of your health care provider before you go and tell them about your travel and your symptoms. They will give you instructions on how to get care without exposing other people to your illness. While sick, avoid contact with people, don't go out and delay any travel to reduce the possibility of spreading illness to others.

Is there a vaccine?

There is currently no vaccine to protect against 2019-nCoV. The best way to prevent infection is to avoid being exposed to this virus.

Is there a treatment?

There is no specific antiviral treatment for 2019-nCoV. People with 2019-nCoV can seek medical care to help relieve symptoms.
